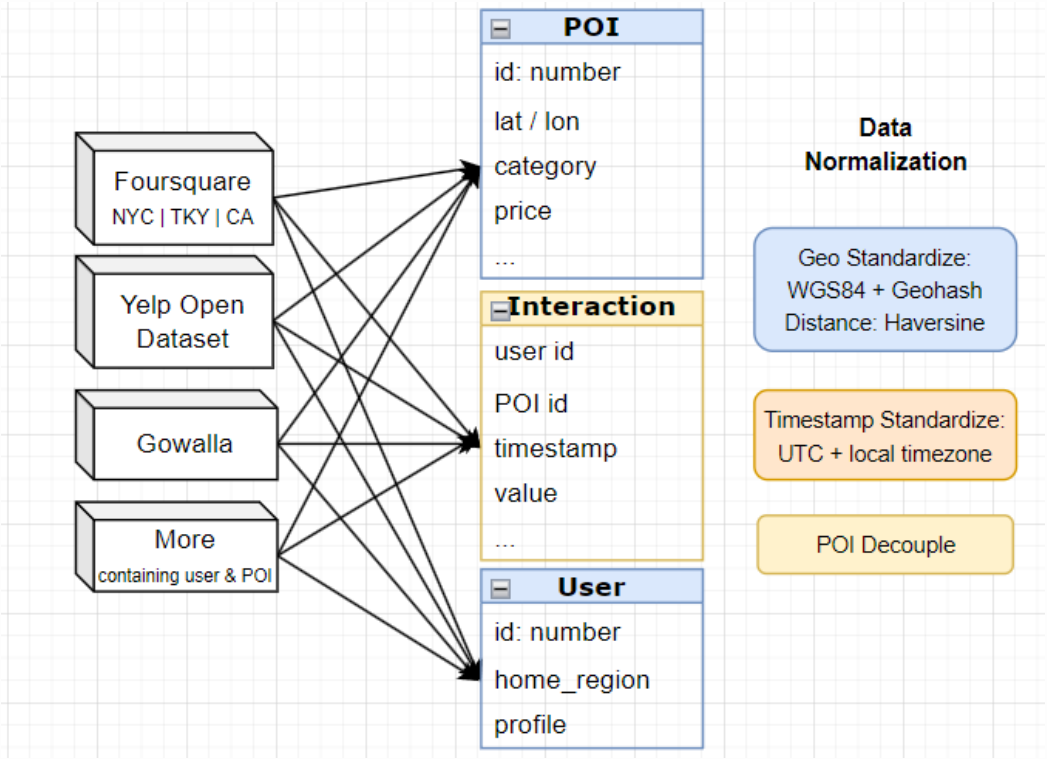
Build a Multi-GT Evaluation Protocol

Step1:

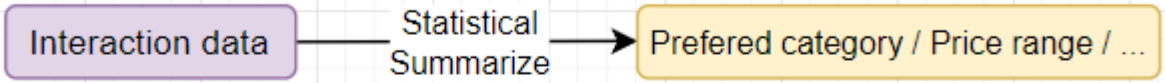
Compatible layer for POI datasets (and real-world hopefully):



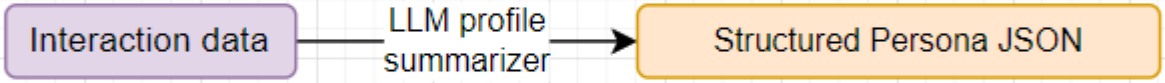
Build a Multi-GT Evaluation Protocol

Step 2: Build User Profile / Persona for query generation (SynthTRIPs - SIGIR 2025):

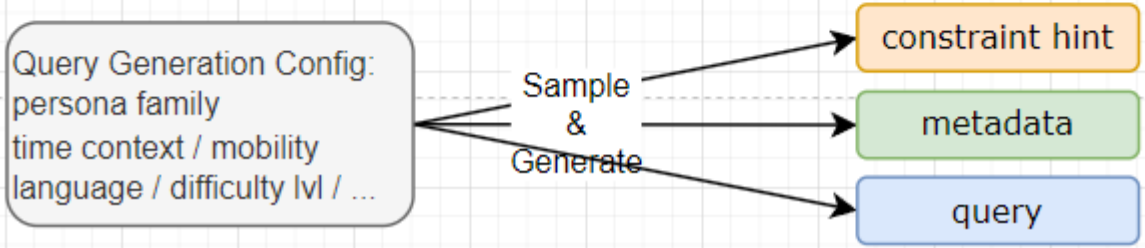
Baseline (as what I've done now):



Future work:

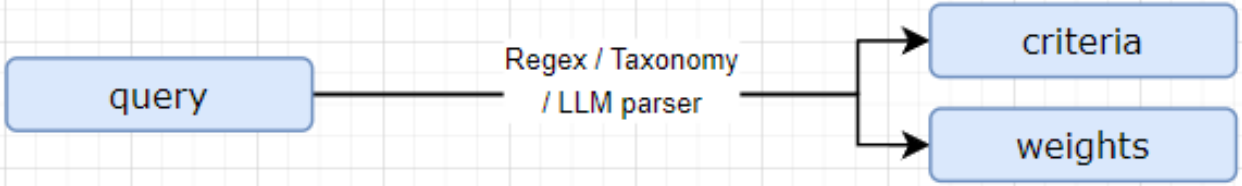


Step 3: Build Query Factory for dynamic query generation (NetArena - ICLR 2026):

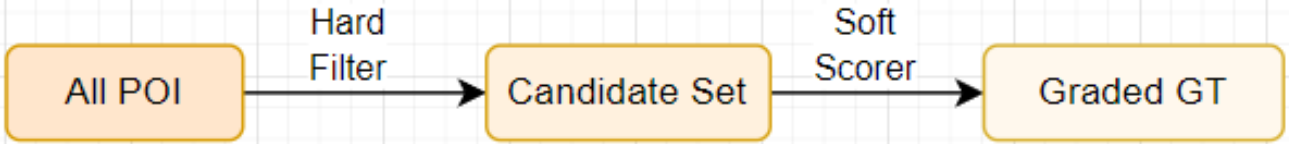


Build a Multi-GT Evaluation Protocol

Step 4: Parse multi-criteria from query (WritingBench - NeurIPS 2025):

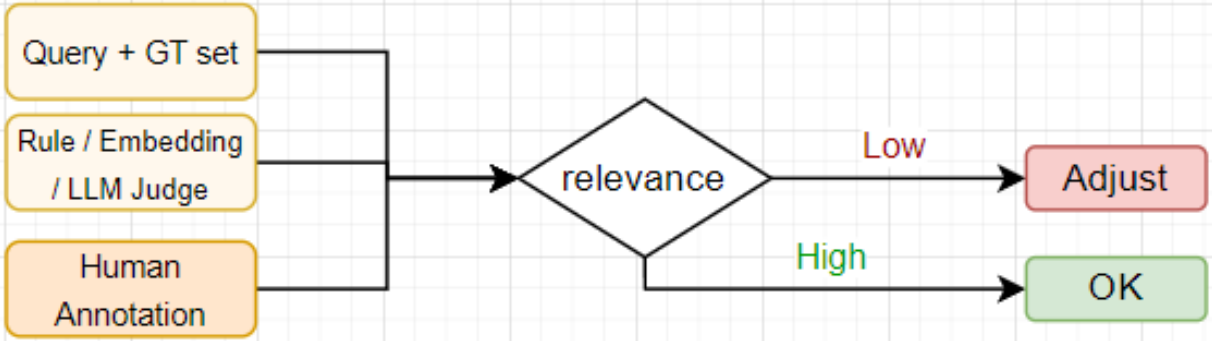


Step 5: Build GT set from Criteria and score with weights:



Build a Multi-GT Evaluation Protocol

Step 6: GT set calibration (TripScore - ~~ICLR 2026~~ Withdrawn for reward model collapse):



Step 7: Metric Selection

Precision@K: System does not give things user does not want
Recall@K: System does not cut off acceptable recommendations
NDCG@K: Better recommendations appears in front
